

FACE READING STUDY BEGINNING CLASS ONE

TRAIT 27.

INNATE SELF CONFIDENCE — (wide face through the eyes; length of face more square and equal with width)

Naturally aware of abilities; self assured; takes-over as a matter of course; thorough; courageous; inspires confidence in others; broad minded. At times may appear as a “know it all” or “a bull in a china shop” to others.

TRAIT 28.

LEARNED SELF CONFIDENCE — (narrow face through the eyes; much more length than width)

Aware of own limitations; willing to learn; prepares ahead to succeed; good follower; narrow minded; becomes successful because of effort. At times, may appear “self conscious” or “shy” to others.

For the sake of comparison, wide, medium and narrow is merely the measurement-term used to distinguish the energy force of a trait. There is no good or bad associated with any trait. All traits are valuable even though they express differently. As in life, there are two sides to everything.

The following photos will give you a comparison of what to look for as you make a study of faces and see the differences between wide square faces and long narrow rectangular faces (and medium faces in-between.)

So you see, it is exciting to know more about these people; the differences!

More specifically, what you want to look for is the shape of the “area” involved: measuring from the turn of the face width at the temples times the length of the face, notice Judy Dench is more square; Nicolas Cage is more narrow showing a rectangular area. Measure from the bottom of chin to where the top of the forehead begins to turn back.

Oh, and notice the actual “physical indicator” of boney-perpendicular-ridges on each side of Nicolas Cage’s temples; this growth of a slight widening shows growth through effort and well-earned “learned confidence.” The same trait shows on Prince Charles, Gary Cooper, Woody Allen and Helen Hunt.

Another example of shape areas are found in the photo of these three young cousins: the middle face is obviously long and narrow and the other two are wider across. All traits have advantages and are perfect.

What you are going to enjoy is going through your family photos and learning something about them that will help you understand their automatic timing responses.

And even more interesting is to look up someone like King Henry the 8th in history and recognize their traits. This work promises you will never again be bored on a bus ride watching people and practicing this study!

The greatest benefit is the value of empowered understanding as you interact with people socially and in business, especially in selling.

In artistic endeavors, this awareness serves your intuitive feel for drawing people, or describing characters in creative writing. And most of all, you are building a foundation of the universal language of lines and shapes to add to your knowledge.

If you see interesting traits feel free to send them to me and together we will expand the examples of this very remarkable study. I guarantee it will soften criticism and nurture loving appreciation for self as well as for others.

A true story.

I had a friend that was left in an orphanage as a very young little girl, crying, standing at the window on a little stool as she watched her uncle leave her there. For years she was taunted and made fun of from other children in the home because of her dear little unusual face. When she discovered this science and began to appreciate her inborn traits and talents, her confidence grew tremendously and she became a very strong advocate of this self-knowledge. In fact, it was through her urging that I began illustrating the traits and designed this book in simple format for easy understanding.

As always I send love's blessings to all,

Irene
